Design：

The word guess game is hangman. User have 5 chance to guess each letter, or lose game.
  First,   it will have many loop:
              it will help count the hanmanword's length,
              judge the word which user input if same with hanmanword(for loop to count
    each letter),
              one loop will decide if user die or win (set number, if user wrong try it will plus
    one until 5).
Input: the hanman word will be   input by user 1 at the beginning , next user will play

Output: Because I set 5 chance, so if user lose, it will be   print   o
                                                                           /
                                                                              \
                                                                              |
                                                                           /
                                                                              \
              Print those each line by line make like a hangman.
    If user win, or lose like <5, the line still show but in the end it will congratulate user win.
